BLUE GRAMA

Primary Uses

Blue grama grows as a bunchgrass that does very well under heavy grazing and a great sod former. Blue grama is also suitable for grass mixtures to be used in erosion control, low maintenance turf plantings, and surface mine revegetation.

Benefits

- Water conservation: Blue Grama can help you conserve water by requiring less watering than other types of grass.
- Reduced mowing: Blue Grama does not need to be mowed as often as other types of grass.
- Attracts wildlife: Blue Grama is a valuable forage grass for wildlife, such as deer, rabbits, and birds.
- Erosion control: Blue Grama is a good choice for erosion control. It can help to stabilize soil and prevent it from washing away.

Varieties

- Lovington
- Hachita
- Alma
- Bad River Ecotype

* All varieties originate from New Mexico except Bad River which originates from South Dakota, but have done well in Texas, Kansas, Missouri.

Why our Blue Grama?

Blue Grama grass is a drought-tolerant, low-maintenance, and attractive grass that can be used in a variety of settings. It is a good choice for homeowners who live in areas with limited water resources, as it requires less watering than other types of grass. Blue Grama also does not need to be mowed as often as other types of grass, which can save you time and money on lawn care. Additionally, Blue Grama is a valuable forage grass for wildlife, such as deer, rabbits, and birds. This can help to improve the biodiversity of your landscape.

Planting/ Sowing Guide

USDA recommends planting 1.5 pls/acre for grazing or hay. 2.0 pls/1000 Sq. Feet is recommended for turf or yards.
